“Supply Chain Management and Analytics”

Data! Data! Data! I can't make bricks without clay!

- Sir Arthur Conan Doyle

Supply chain analytics refers to the process's organizations use to gain insight and extract value from the large amounts of data associated with the procurement, processing, and distribution of goods. Supply chain analytics is an essential element of supply chain management (SCM).

The discipline of supply chain analytics has existed for over 100 years, but the mathematical models, data infrastructure, and applications underpinning these analytics have evolved significantly. Mathematical models have improved with better statistical techniques, predictive modeling, and machine learning.

Army Institute of Management and Technology conducted a guest session on ‘Supply Chain Management and Analytics: Present Prospects and Opportunities’ on 29 May 2021. It was an honor for us to have Mr. Karan Bhatnagar, Sr. Manager, Schneider Electric. He provided many insights and practical cases of Schneider Electric and connected it through supply chain management and analytics. The objective of this session was to make the students understand the supply chain management and analytics during pre and during Covid Pandemic.

The key takeaways which one can get from the session are as follows:

- How to manage supply chain.
- What factors affect our supply chain.

The session ended with a question answer session where Mr. Karan Bhatnagar answered the queries put up by the students of AIMT. In the end, Dr. Mritunjay Kumar, Asst. Professor (Operations) presented the vote of thanks.
